

SPECIALISED IN PLANNING AND EXPANDING

BeerBev: a neutral and independent engineering and consulting company

Oliver Wesseloh has just won the Beer Sommelier World Championship. On Sunday, 15th of September, 54 beer sommeliers from ten different countries competed against each other and demonstrated their knowledge of beer styles, brewing techniques, service methodology, and the pairing of food and beer.

About the new Beer Sommelier World Champion

Oliver is a beer lover and a beer expert. He is a graduated engineer in brewing technology with a wealth of experience in the beer industry. He is able to combine passion, creativity, knowledge, and a great deal of ambition. Apart from his job as a beer sommelier he is also making progress with his Kehrwieder Kreativbrauerei, a Craft Brewery in Hamburg. Together with his partner Friedrich Matthies he has already brewed a number of beers. Their first and most popular beer is the prototype – a strong, dry hopped Lager.

Experience in the brewing and beverage industry

And there is a third field of activity in Oliver's professional career – one that is most important to us at BeerBev LLC: He is an established member of the company's team.

BeerBev is a neutral and independent engineering and consulting company that is specialised in planning new breweries or expanding existing plants and brewing facilities. The company is proud to have Oliver on board. The team members have more than forty years of experience in the brewing and beverage industry and are able to provide individual, best in class solutions.

They have the skills and the knowledge to satisfy the customers' needs when it comes to engineering, software, or brewing technology. We offer individual, leading edge optimisation and harmonisation solutions.

This includes e.g. to assist the customers in many different ways in order to sustainably improve their brewing technology. The company is able to provide solutions that enhance the quality, efficiency, and flexibility of a brewery or

beverage company regardless of its size – from 10-hl brews up to a 1500-hl brew size. This can include the development and realisation of a new beer, the required adjustment and alignment of the relevant production processes for increased process yield, the reduction of product losses, the optimisation of raw material usage, as well as less water and energy consumption.

BeerBev wants to enable an efficient and environment-friendly production while meeting highest quality standards in the best interest of its customers. Beyond this, regardless of the variety and complexity of the scope, the team of experienced brewing scientists and process engineers will evaluate the existing processes with the objective to increase capacity without major Capex spending.

Create solutions

Like Oliver, all the team members are experts and enthusiasts in their field. The company wants to offer real insight and practical experience with passion. As the extended arm of the customer's engineering department solutions are created, from pre-planning, engineering, brewing technology, and software up to project execution. This may also include construction drawings for local manufacturing. The operational excellence is directly measurable on the client's bottom line. □
